

COMARCH

Comarch tPro Mobile

Protect your data and money on the go

Comarch tPro Mobile is a handy solution for mobile-based customer authentication and authorization. Distributed as a standalone app or additional security layer for the existing apps, it is dedicated for online banking and e-commerce.

Our product provides a wide range of authentication mechanisms: from traditional PIN codes to biometrics. Thanks to full OATH compatibility, Comarch tPro Mobile can be used as a 2FA authentication component for critical resources such as email, administrative panels, or social media. It can also verify bank transfers, so the sender knows they go to the right accounts.

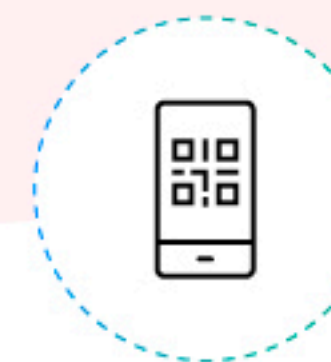

Selected capabilities

Proactive security

Before a transfer order is sent to the bank, the user is required to retype part of the amount or account number, and only then accept the operation.

Easy onboarding

By scanning a secure QR code generated on a website, the user can register in the app and from then on use a smartphone to get secure access to selected services and accounts.

Cryptography layer

All the information shown on the screen undergoes an integrity check beforehand, which protects the user against unauthorized data modification.

Input protection

Sensitive data (PIN code, account number) is stored in an encrypted part of the device memory for maximum security.

Document signing

DOCs, XMLs or PDFs can be easily signed, verified and protected against unwanted changes.

Strong customer authentication

Biometric authentication

Transaction authorization

Document signing

PSD-2 compliant

Anti-tampering engine

Key advantages

- Exceptional user experience
- Easy integration with 3rd party apps
- Protection against remote attacks (MITM and MITB)
- Low ownership and maintenance cost

Extend your product

tPro Mobile is delivered in two versions:

- as a standalone application distributed for android and iOS platforms, **or**
- as an SDK for integration with existing mobile applications.

The first solution is great for products where users need a separate 2FA mechanism, i.e. a second factor for online authentication. The second is recommended as a security extension for existing solutions.
